fall()，可以分為三部份來看:

由底至上確認是否碰撞

```cpp
bool collision = false;
int ref_row, ref_col;

//collide
int cur_row = h-1;
while(cur_row < row) {
  collision = test_collision(block, w, h, start_col - 1, cur_row);
  if(collision == true) {
    // put block on cur_row-1
    if(cur_row >= h)
      // valid on cur_row-1
      ref_col = start_col-1;
      ref_row = cur_row-1;
      break;
    } else {
      cout << "no space to put block (illegal testcase)" << endl;
      return;
    }
  } else if(cur_row == row-1) { //last row
    // valid on cur_row
    ref_col = start_col-1;
    ref_row = cur_row;
    break;
  }
  cur_row++;
}
```

✧ 確認碰撞即可開始 move

```
//move
if(move > 0){
  //move right one by one
  for(int i = 1; i < move; i++){
    if(test_collision(block, w, h, ref_col+i, ref_row)) return;
  }
  ref_col += move;
}else{
  //move left one by one
  for(int i = 1; i < -move; i++){ //fix a bug
    if(test_collision(block, w, h, ref_col-i, ref_row)) return;
  }
  ref_col += move;
}
```

移完仍需確認是否可再往 fall

```
// try to move down if can
while(ref_row < row-1) {
  // try next row
  collision = test_collision(block, w, h, ref_col, ref_row+1);
  if(collision) {
    break;
  }
  // move to next
  ref_row++;
}
```

delete_row()，可分為兩部分來看:

從下開始檢查是否有滿 row

```
int dest_row = -1;

for(int i = 0; i < row; i++) {
  int * ptr = &gameboard[row - i - 1][0];
  bool full = true;
  for(int j = 0; j < col; j++) {
    if(ptr[j] == 0){
      full = false;
      break;
    }
  }
  if(full) {
    if(dest_row == -1)
      dest_row = row - i - 1;
  } else {
    if(dest_row != -1) {
      int* dest = &gameboard[dest_row][0];
      for(int j = 0; j < col; j++){
        dest[j] = ptr[j];
      }
    dest_row--;
    }
  }
}
```

✧ Fill rest row

```
// fill rest row
while(dest_row>=0) {
    int* dest = &gameboard[dest_row][0];
    for(int j=0;j<col;j++){
        dest[j] = 0;
    }
    dest_row--;
}
```

2) Test case Design

2-1) Detailed Description of the Test case

以下為運作呈現圖形(擷取重要部分)
執行 J4 35 2 的 block 及其 block fall 之前的 gameboard

```
start=35 move=2

主要設計的重點放於以下重點:

✓ 是否是設計往下移動碰到底再往右移動，而非一開始就直接在移動位置上。

關於同學測資整理一些誤區:

✓ 是否在碰撞前，有檢查 block 高度是否已超出邊界
✓ 誤會指令型式，例如:不能有一行只有"\n"
